How to Make a Behavior Intervention Plan for an Autistic Child

Autism is a developmental disorder characterized by difficulties with social interaction and communication, and by restricted and repetitive behavior. Parents usually notice signs during the first three years of their child's life. These signs often develop gradually, though some children with autism reach their developmental milestones at a normal pace before worsening.

Another way in which parents reinforce negative behavior is by giving in. If a parent tells a child he can't go outside, but then the child begs and pleads until the parent gives in, the child's whining has been positively reinforced. The child learned that whining helps him get what he wants and he's likely to whine again in the future.

Positive Reinforcement to Improve a Child's Behavior

Autism is a neurodevelopmental disorder that affects language development and social function. The uncertainty about what causes autism in the majority of "idiopathic" cases, has hampered the development of a universally beneficial treatment, aside from symptomatic treatment of autism-related behaviors such as aggression or anxiety. Limited clinical evidence raises the intriguing ...
