Digestive physiology. As a consequence of the length of food retention time in the gut, browsers such as okapi tend to eat little and often, whereas grazers eat in less frequent bouts (Hummel et al. 2006a). Fast food retention times, and therefore eating little and often, directly influences the feeding behaviour of okapi,...

The Physiology Department of the Rowett Institute was very active under Phillipson and he continued his contributions in digestive physiology, microbiology, organic and inorganic nutrition, metabolism and pathology and the training and development of a considerable number of post-graduates and young scientists.

the physiology the cardiovascular and the digestive system in the body in relation to energy metabolism in the body. Discuss the role of energy in the body and analyse how those two body systems interrelate to perform a named functions. For distinction analyse Energy it is the ability to do work.

There has been a steady increase in the amount of information available on the digestive physiology of herbivores such as sloths, porcupines, and kangaroos. Evolution of the artiodactyl, of equid and ruminant digestive strategies, and of microbial digestion in mammals is discussed in the chapter.

Learning Objectives. Hormones secreted by several endocrine glands, as well as endocrine cells of the pancreas, the stomach, and the small intestine, contribute to the control of digestion and nutrient metabolism. In turn, the digestive system provides the nutrients to fuel endocrine function.

### **23.1 Overview of the Digestive System - Anatomy and Physiology**

The Digestive System and Body Metabolism. Metabolism is the process that your body uses to convert the food and drink that you consume into energy. The digestive system and body metabolism work together to ensure that your body is consistently and efficiently energized to carry out normal day-to-day tasks, as well as background bodily functions.
